# Improving Defense Readiness with Generative AI

Using artificial intelligence in the defense and security industry can improve efficiency, reduce costs, and increase overall reliability.

A single, major weapons system program can account for trillions of dollars in spending over its lifetime. Vast data pools are available on weapons supply chain operations, depot inventory, sensor readouts, testing results, and maintenance reports. This data informs countless critical decisions, impacting both budgets and defense readiness.

Yet despite those high stakes and deep data resources, many defense decisions may rely on snapshots of current posture. Data that is not forward-looking, predictive, or complete contributes to inefficient spending and reduced readiness. In addition, a lack of accurate information may lead to operational issues, such as delayed maintenance, understock and overstock of spare parts, and overlooked patterns of anomalies and impending failures.

Generative AI (GenAI) stands out in the defense sector for its extraordinary capacity to process and interpret diverse and voluminous data sets. Unlike traditional data analytics, GenAI can seamlessly analyze information ranging from intricate sensor data to extensive logistical records. This advanced technology excels in pattern recognition and predictive analytics, offering a proactive approach to defense strategy.

GenAl can be used to predict maintenance needs, identify supply chain disruptions, and foresee potential system failures. This forward-looking capability is crucial, allowing for early interventions that prevent operational disruptions. GenAl's predictive power extends beyond mere data analysis; it can simulate various scenarios, providing strategic insights for defense planning. These capabilities mark a significant shift from reactive to proactive defense management, ensuring higher operational efficiency and readiness.

According to "<u>The State of GenAl Today: The Early Stages</u> of a Revolution"—a 2024 survey of senior executives across commercial and public sectors that Guidehouse conducted in partnership with CDO Magazine—just 8% of government respondents expressed GenAl readiness. More than threequarters (76%) of all respondents said their organizations are not ready to capitalize on GenAl's benefits, with a full 42% saying they expect it be difficult or very difficult to integrate GenAl solutions into their current infrastructure, processes, and workflows.

## **GenAl Use Cases**

GenAl has the potential to revolutionize defense readiness, real-world effectiveness, and future potential within the defense sector.

**Predictive maintenance**: Consider the use of GenAl in predictive maintenance within aircraft systems. Al algorithms analyze data from aircraft sensors, identifying patterns that precede equipment failure. This approach can significantly reduce unplanned maintenance, ensuring higher availability of aircraft for missions.

**Inventory predictability**: Defense supply chains are among the most complicated in the world. Some of the most important defense systems have six or seven tiers of suppliers. By analyzing supply chain data, AI predicts inventory needs, optimizing the stock levels of spare parts. This not only cuts down on excess inventory costs but also ensures that critical components are readily available for mission-critical operations.

# How GenAl Can Help

Large language models (LLMs), which form the heart of GenAl, can address defense industry challenges by analyzing maintenance logs, sensor data, operating manuals, and field-generated insights. After ingesting and learning, traditional Al models can identify patterns and anomalies that can be used to predict failures. Human domain experts can then jump in to fine-tune specific details and help identify significant past maintenance failures to improve the performance of these models.

LLMs can quickly hunt through vast data pools to find evidence of past failures or markers for potential future failures. These insights can then be used by both scheduling algorithms and human experts to create new, superior maintenance schedules to address potential issues before they become faults. This in turn reduces unexpected downtime and maintenance costs. Vector databases can store embedded equipment logs, making it easier to further fine-tune repair and ordering protocols to drive more waste out of the industry.

In more advanced implementations, GenAl can perform the tasks of an interactive agent analyst, augmenting or even replacing data analysts in defense programs. With access to not only raw data but deep insights, these agent analysts can answer comprehensive inquiries about systems readiness and prepare reports quickly and efficiently. They can act as a lever and bring more self-service analytic capabilities to defense decision-makers.

#### **Key Benefit Areas**

Integrating GenAl into existing defense infrastructures is critical to its adoption. GenAl is designed to augment, not replace, current systems. It acts as an advanced layer of intelligence, enhancing the capabilities of existing platforms. The integration process, therefore, focuses on interoperability and complementarity, ensuring that GenAl works in tandem with traditional systems. GenAl can benefit the broader, multi-tiered defense industry by improving reliability and readiness in subsystems across multiple categories of weapons platforms, including:

*Aircraft systems*: (Engines, rotors and gearbox, landing gear, avionics) *Naval systems*: (Propulsion, electrical, navigation, and communication) *Weapons systems*: (Guidance and targeting, barrel wear) *Ground vehicles*: (Engines, brakes, transmissions)

## **Ethical and Compliance Considerations**

Looking ahead, the evolution of GenAl promises even more sophisticated applications in defense. Future advancements could include autonomous decision-making systems and more intricate simulation models. But this growth brings challenges and ethical considerations that necessitate establishing clear, comprehensive GenAl regulatory frameworks to ensure ethical alignment, robust cybersecurity, data privacy safeguards, and human oversight.

According to the survey, 77% of respondents reported that their organizations' GenAl regulatory compliance and ethical guidelines were vague or unclear. As part of a strategic, nuanced approach to creating such guidelines, enhancing Al output documentation and transparency is key for building trust and facilitating effective governance. Respondents who expressed confidence in their organizations' ethical, compliant use of GenAl reported that 75% of their Al outputs were fully documented.

Integrating robust data privacy frameworks within GenAl is also critical for safeguarding against privacy breaches and maintaining organizational reputation. With only 38% of respondents claiming to have effective GenAl data privacy practices in place, there is clearly a need for this to be prioritized.

Navigating these challenges is essential for realizing the full potential of GenAl in defense readiness while safeguarding against potential risks.

#### About Guidehouse

Guidehouse is a leading global provider of consulting services to the public sector and commercial markets, with broad capabilities in management, technology, and risk consulting. By combining our public and private sector expertise, we help clients address their most complex challenges and navigate significant regulatory pressures focusing on transformational change, business resiliency, and technology-driven innovation. Across a range of advisory, consulting, outsourcing, and digital services, we create scalable, innovative solutions that help our clients outwit complexity and position them for future growth and success. The company has more than 16,000 professionals in over 55 locations globally. Guidehouse is led by seasoned professionals with proven and diverse expertise in traditional and emerging technologies, markets, and agenda-setting issues
