Accounting and Financial Reporting

We provide value to financial organizations by not only supporting routine operations, but by transforming efficiency and speed through automation, business process re-engineering, policy analysis, and other innovative techniques.

Audit Remediation Strategic Planning and Execution

Remediation should be strategic and consider first-hand audit knowledge – Guidehouse delivers both.

Audit Preparation and Liaison Support

We leverage our experience and audit knowledge to prepare our clients and deliver thoughtful communication for smooth audit experiences.

Budget and Performance Management

We understand the interconnectedness of budgets and mission performance and work to achieve or improve their alignment through forecasting modelling, execution support, and technology.

Data Analytics

Guidehouse unlocks the power of data to enable deeper insights and better, proactive decision-making. Automated anomaly scanning, predictive modeling, dynamic data visualization are just a few of the possibilities.

Cost Estimation and Modelling

Achieving cost-effective operations that are backed by justified business cases is critical as organizations are asked to do more with less. Guidehouse offers leading cost accounting, modeling, cost estimation techniques to support acquisition programs, user fee programs, working capital fund functions, and more.

Internal Control Program Optimization and Implementation

Financial reporting, operations, compliance – these are a few of our favorite things. We are leaders in establishing, implementing, and optimizing internal control and risk management programs to drive data integrity and real time monitoring across business processes and information technology.

Technology Transformation

ERP, Cloud, SharePoint, Robotics, Artificial Intelligence, and more – Guidehouse offers expertise across current and emerging technologies tailored to your modernization objectives to help finance organizations reduce costs of maintaining legacy systems, optimize the way data is stored and distributed, and reallocate workforce talent from manual data entry or extraction to value-added activities.

Guidehouse: Solving Important Problems

- We established an analytics protocol to scan millions of dollars of federal disaster spending for potential fraud in the use of purchase cards. Our team identified high risk transactions for further analysis and recommended mitigation strategies for the future.
- Our robotics process automation implementation automated improper payment data collection and analysis at a government agency. This saved the agency days of time that was reallocated to more value-added analysis.
- Our Continuous Audit Readiness (CAR) solution integrates data management, analysis, and visualization capabilities with the accounting and financial processes to reduce error in financial reporting, synthesize millions of data transactions, and inform remediation strategies.
- Our SharePoint solutions standardize and organize decentralized internal control programs to make sense of data necessary for forward-looking risk management across an agency.
- One of our recent GRC tool implementations enabled an agency to better manage its decentralized internal control program across 20+ components, through process automation, workflow notifications, and real-time progress visualization.
